# Git Kata 3

## Status

# The Status Command

Today you will be practicing using the `git status` command to check your changes between adding and committing them.

# Exercise

- In your terminal, navigate to your mini-project directory.
- Add your changes to your local repository.
- Use `git status` to check that all the changes you expect to have been added are present (and none that you did not expect).
  - Remember: staged changes will appear in green, while unstaged changes will be red.
- Commit your staged changes locally and then push them to the remote repository.
